World Meteorological Organisation confirms *'Acceleration'*

"... we underestimated the rate of change, the warming is not just continuing, by many measures it is accelerating." (27th July 2026)

From the outset in 1990, GCI recognised the immense danger of climate change.

"Contraction & Convergence" (C&C) was tabled at UNFCCC COP 1996. & it attracted globally significant support over the next 15 years.

However, advised by persistently inadequate climate science, the political process not only failed adequately to contract greenhouse gas emissions, it actually accelerated them from 7 to 14 Billion Tonnes of Carbon emission by 2025.

Reflecting the effect of non-CO2 feedbacks the rate of acceleration of temperature is now faster than the acceleration-rate of atmospheric CO2 concentrations.

GMS say temperature will unavoidably now rise to 3° Celsius above preindustrial by ~2050.

In his only interview before Cop30 climate summit, António Guterres acknowledged it is now "*inevitable*" that humanity will overshoot the target in the Paris climate agreement, with *"devastating consequences"* for the world.

He urged the leaders who gathered in the Brazilian rainforest city of Belém to realise that the longer they delay cutting emissions, the greater the danger of passing catastrophic *"tipping points"* in the Amazon, the Arctic and the oceans.

"Let's recognise our failure.

The truth is that we have failed to avoid an overshooting above 1.5C in the next few years and that going above 1.5C has devastating consequences.

Some of these devastating consequences are tipping points, be it in the Amazon, be it in Greenland, or western Antarctica or the coral reefs."
