Global commons or global chaos

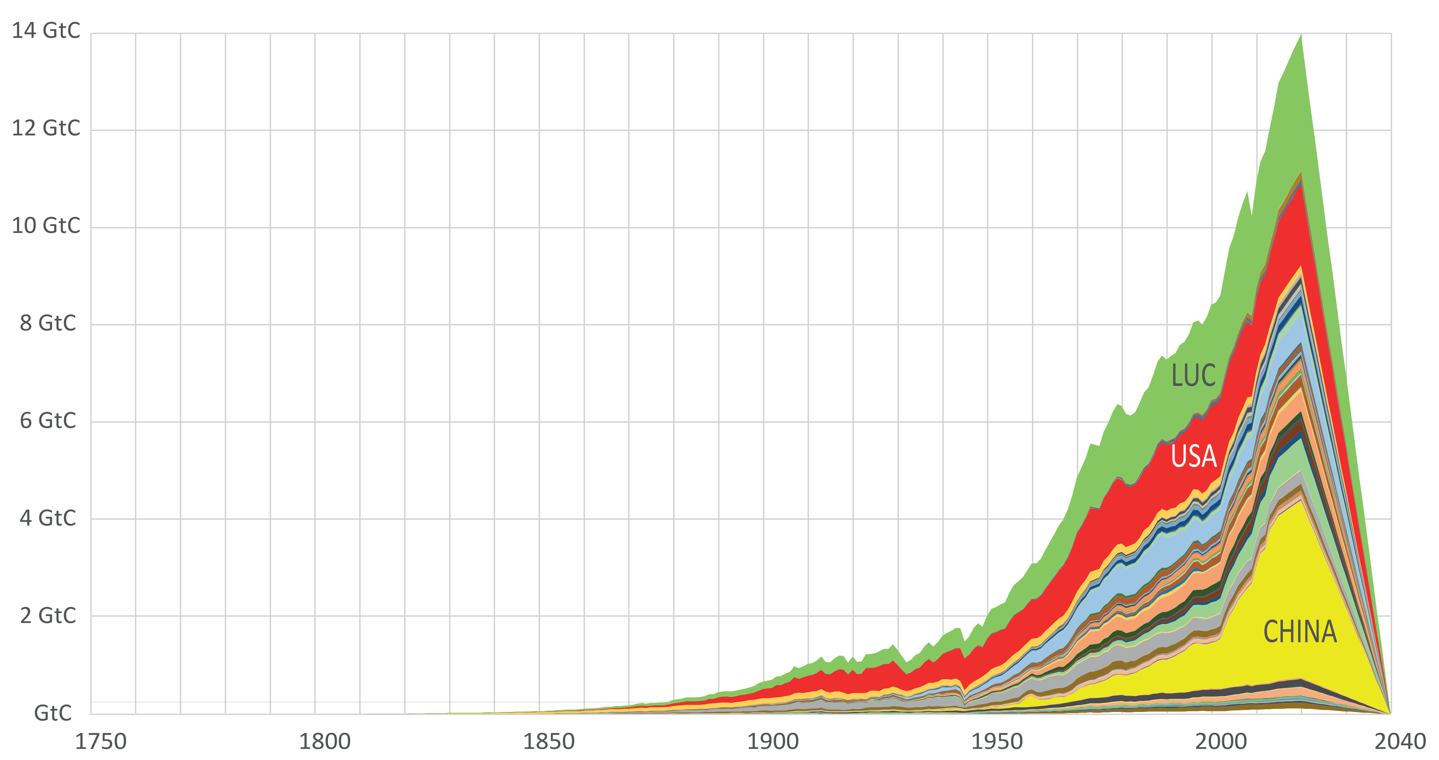
All we can know is that trying (yet-again) to deliver zero-emission globally without global coordinates and governed by the casino-economic model that got us into to this emergency, leaves us pointing at catastrophe.
The refence is the global per capita average of carbon consumption going to '0' by d-date eg 2040. That is the guard-rail which we are all now holding for dear life, lest continuing without this, continues the journey of *every man for himself'* towards extinction . . . . .

Detailed historical breakdown here: -

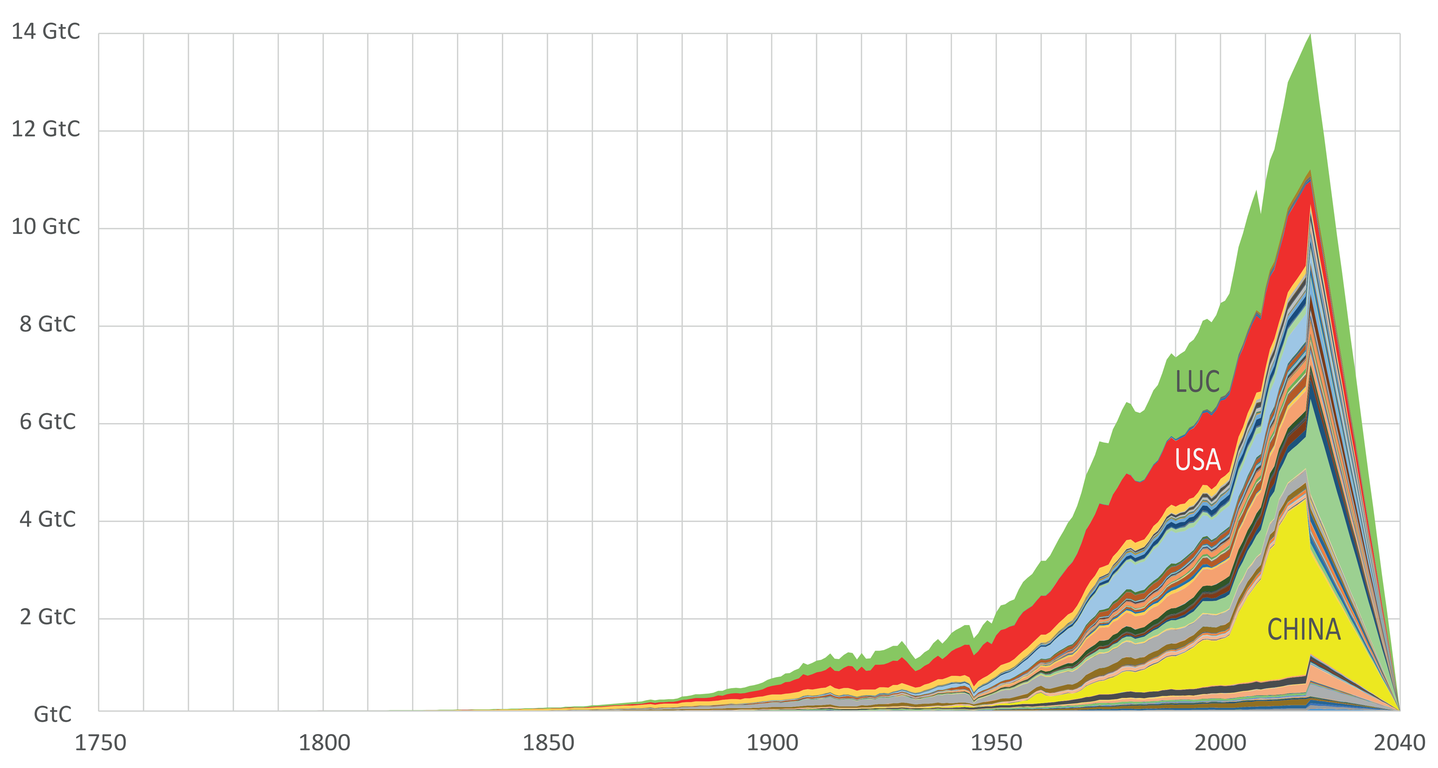
http://www.gci.org.uk/CREDIT-DEBIT_Breakdown.html

This created the 'climate emergency'

All Countries Expand & Diverge Carbon (CO2 Emissions) 1750 (0) to 2020 (14 GtC) then **PRO RATA**
All Countries Contract & Converge Carbon (CO2 Emissions) to zero between 2020 & 2040



All Countries Expand & Diverge Carbon (CO2 Emissions) 1750 (0) to 2020 (14 GtC) then = **PER CAPITA**
All Countries Contract & Converge Carbon (CO2 Emissions) to zero between 2020 & 2040

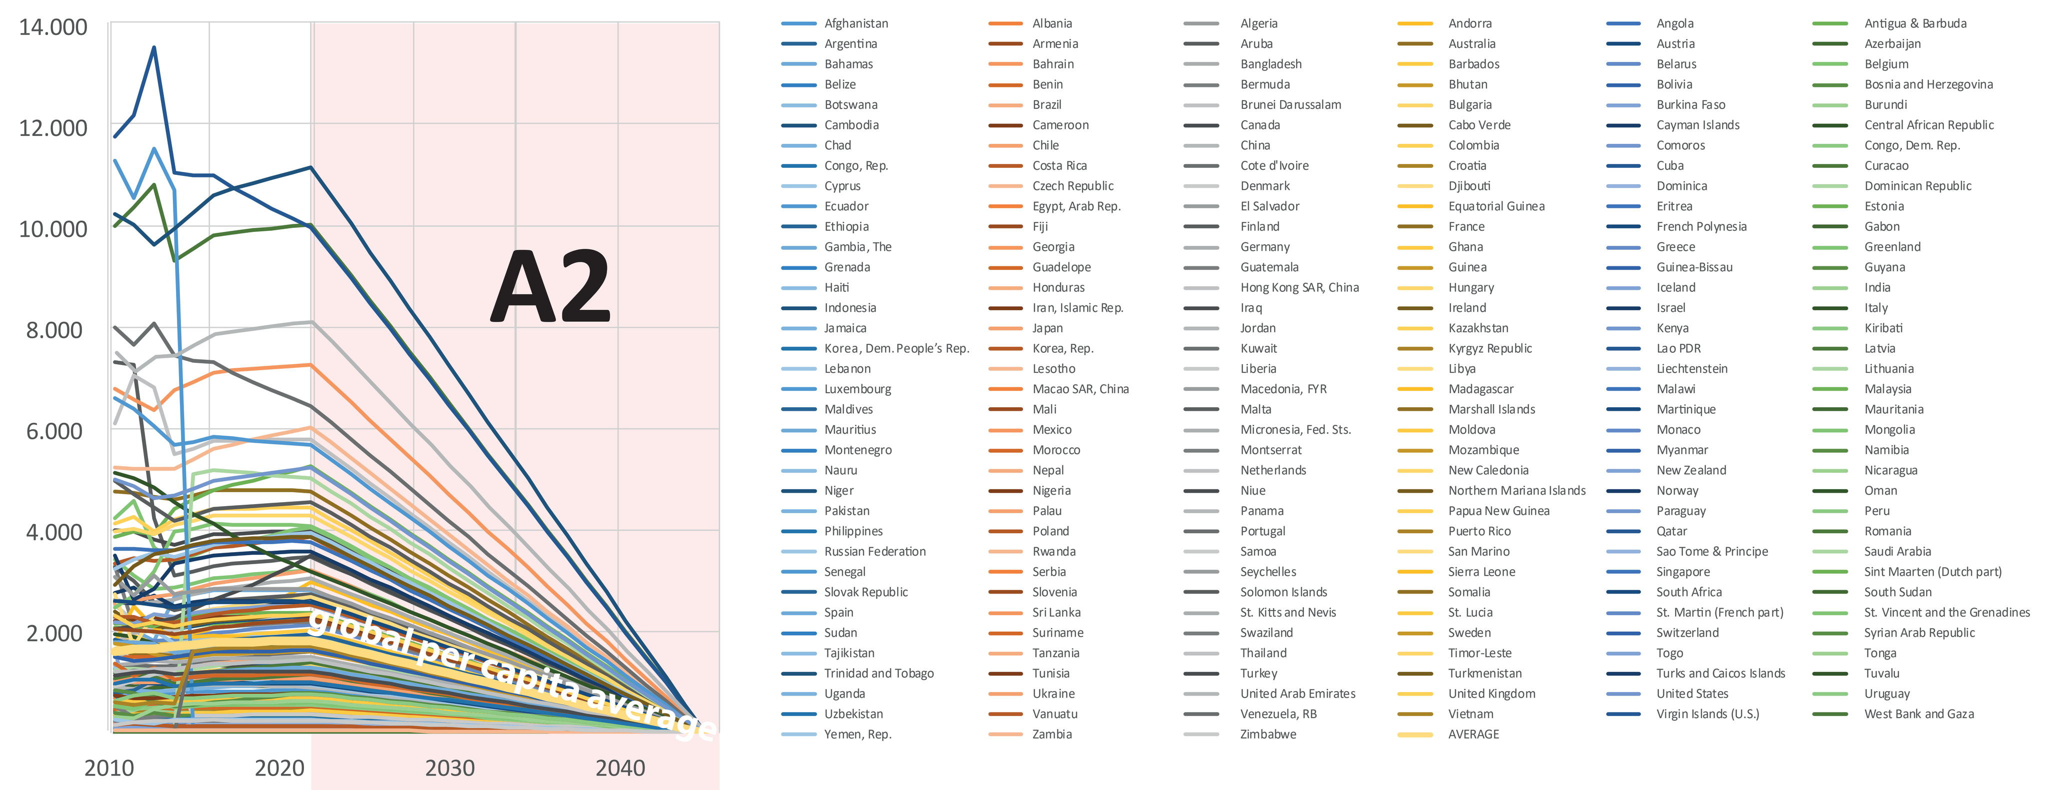


'A' is the rate, 'B' is the pre-distribution. International 'Credit-Debit' differences between A & B are'tradable' within this global structure. Structure is sine-qua-non.

International Emissions Contraction Rate 2020-2040 Entitlements Pro Rata (Caldecott Carbon Brief)
Freeze-off future entitlements where they are in 2020 & go collectively to zero by (eg) 2040

International Emissions Contraction Rate 2020-2040 Entitlements Per Population (base year 2020)
Pre-allocate future entitlements equal to population in 2020 & go collectively to zero by (eg) 2040

The global-per-capita-average-of-carbon-consumption is the global reference for the structure. We can't trade what we do not own, without this structure we still have random, unequal & chaotic, *'uneconomic-growth'*.



'B' is the pre-distribution of 'A'
